Executive Summary

Purpose: The MO HealthNet Pharmacy Program will implement a state specific preferred drug list.

Why was this Issue Selected: Fibromyalgia is characterized by chronic widespread pain and heightened painful response to pressure. The underlying cause of fibromyalgia is unknown. Diagnosis is based on expert opinions. It affects 0.5% to 5% of the general population and up to 15.7% in a clinic setting. Clinical guidelines recommend a multidisciplinary approach with short-term use of medication for relief. There are three FDA approved medications for management of fibromyalgia: pregabalin, duloxetine and milnacipran. Current evidence supports the safety and efficacy of the approved agents as monotherapy for up to 6 months for Cymbalta[®], Drizalma Sprinkle[™], and Lyrica[®] and up to 3 months for Savella[®]. Many other agents are used off-label for management of fibromyalgia. Combination therapy of approved or off-label medications can potentially cause severe adverse events, drug interactions and interfere with disease management. Studies also show the efficacy of these agents in managing fibromyalgia decreases over time.

Total program savings for the PDL classes will be regularly reviewed.
