Executive Summary

Purpose: The MO HealthNet Pharmacy Program will implement a state specific preferred drug list.

Why Issue Selected: Tramadol is a fully synthetic opioid pain medication used to treat moderate to moderately severe pain. When taken as an immediate-release oral formulation, the onset of pain relief is usually within an hour. Tramadol binds to the Mu-opioid receptor and inhibits the reuptake of serotonin and norepinephrine. Serious side effects may include seizures, increased risk of suicide, serotonin syndrome, decreased alertness and drug addiction. Common side effects include constipation, itchiness, and nausea. In fall 2014, the DEA reclassified the painkiller tramadol as a Schedule IV controlled substance because it can be addictive, misused, and diverted.

Total program savings for the PDL classes will be regularly reviewed.
