Executive Summary

Purpose: Ensure appropriate utilization and control of 2nd Generation (Atypical) Antipsychotics and to impose a state-specific open access reference drug list

Why Issue Selected: Atypical or 2nd generation antipsychotics are a class of antipsychotic drugs which may be used to treat a variety of psychiatric conditions including schizophrenia, bipolar disorder, depression, anxiety, insomnia, agitation, and aggression. The older typical or 1st generation antipsychotics have a significant potential to cause extrapyramidal side effects and tardive dyskinesia; atypical or 2nd generation antipsychotics have a lower likelihood of these symptoms and are now considered first line therapies. With the implementation of the Substance Use-Disorder Prevention that Promotes Opioid Recovery and Treatment for Patients and Communities (SUPPORT) Act, state Medicaid programs have new requirements regarding prescription drug utilization reviews, including a program to monitor and manage the appropriate use of antipsychotic medications (both typical and atypical).

Atypical or 2nd generation antipsychotics are consistently found on our quarterly top 25 drugs by cost. This edit does not restrict access to any atypical or 2nd generation antipsychotic but contains a reference product list. Agents on the reference product list are manufactured by pharmaceutical companies who offered a supplemental rebate to help MO HealthNet control spiraling drug costs. We encourage prescribing providers to use the reference products whenever possible.
