Executive Summary

Purpose: Ensure appropriate utilization and control of clobazam agents

Why Issue Selected: Clobazam is indicated for the adjunctive treatment of seizures associated with Lennox-Gastaut syndrome (LGS). LGS is a severe form of epilepsy usually beginning before four years of age. Seizure types include tonic, atonic, atypical absence, and myoclonic. As children with LGS grow older, the seizure types change. Some children have developed normally when LGS begins, but then lose skills, sometimes dramatically, due to uncontrolled seizures. By age six, most children with this syndrome have some degree of mental retardation. Behavioral problems are also common, ranging from hyperactivity to autistic behaviors. Treatment of LGS includes a variety of anti-epileptic medications. Clobazam products provide additional treatment options for LGS and are now available in tablet, liquid, and film formulations.

Although it does not have an FDA approved indication, clobazam is considered a first line agent for the treatment of Dravet syndrome. Dravet syndrome is a rare form of epilepsy typically appearing during the first year of life with frequent or prolonged seizures. Previously known as Severe Myoclonic Epilepsy of Infancy (SMEI), Dravet Syndrome affects 1:15,700 children, 80% of whom have a mutation in their SCN1A gene. Children with Dravet syndrome typically experience poor development of language and motor skills, hyperactivity, and difficulty relating to others. Although an off-label indication, MO HealthNet will approve clobazam for use in Dravet syndrome.
