## Executive Summary

**Purpose:** Ensure appropriate utilization and control of select topical agents for acne and rosacea

**Why Issue Selected:** Acne is a chronic inflammatory condition presenting as comedones, papules, pustules, and nodules. Oil production, dead skin cells, clogged pores, and bacteria can all work together to cause acne. Acne affects about 50 million people in the United States, including 85% of adolescents and 12% of adult women. There are a variety of agents for the treatment of acne with a wide range of cost.

Rosacea is a chronic inflammatory condition, predominately affecting the facial skin and eyes, which typically presents any time after 30 years of age as flushing or redness on the cheeks, nose, chin, or forehead that may come and go. Rosacea is estimated to affect over 16 million people in the United States. There are a variety of topical and oral agents available for the treatment of rosacea.

Due to the large patient population affected and the variety of therapies available, it is fiscally advantageous for MO HealthNet to manage utilization of higher cost therapies. This edit will focus on expensive topical agents that are not currently being edited by other means.
